Localization

 **PHP < 5.2**
In PHP version less than 5.2, timezone settings do not exist, so the timezone defaults to the server time.

Confirm Private Key Passphrase

••••••••

☐ I have saved this passphrase to a safe location

Update Passphrase

This section supports setting a passphrase that is used to encrypt payment account (credit card and bank account) numbers stored within Blesta. The passphrase set here is not stored anywhere, so if set payment account details can not be decrypted by Blesta. This prevents auto debit from running, clients from processing payments using stored payment accounts (though they can still process payments with new payment details), and Staff members must enter the passphrase in order to view account numbers.

If a passphrase is set payments must be manually batched under [Billing] > [Batch].

Setting an encryption passphrase will disable auto-debit

If enabled, encrypted payment account details can only be decrypted using the set passphrase. This means auto-debit, and the ability for clients to process payments using stored accounts will be disabled. Payments will have to be manually batched under [Billing] > [Batch].

Contact Types

Contact types allow for additional "Account Types" to be selectable when adding a contact to a client profile. By default, a contact type of "Billing" is available. Additional contact types can be added here. Currently contact types serve the purpose of manually sorting contacts into categories. Some examples of new contact types might be for support, development, or manager roles.

Access permissions can be set for Contacts if the contact is set to be able to login, by both Staff, and Clients.

Contact Types		
		+
Name	Uses Language Definition	Options
Contact Type Name	No	Edit Delete

Creating a new Contact Type

To add a new contact type simply enter the same of the contact type (e.g. Technical)

Create Contact Type
