About Blesta

Blesta is a well written, security focused, user and developer friendly client management, billing, and support application. Written in PHP on our very own open source minPHP MVC framework, Blesta is object oriented and extendable.

Blesta was initially written internally for Phillips Data, Inc., our parent company, in 2003 as no other suitable solutions were available. In 2007, Blesta v1 was released publicly. The popularity of Blesta started to grow immensely with its v2 release, due to its extraordinary simplicity. Now completely rewritten as of v3, it carries on with simplicity and ease of use in mind, with the best back-end and front-end we could build. We take a no-compromise approach to doing things right.
