## Settings

## Inheritance

Settings are tiered into four sections, maintaining a hierarchy:

- System Settings
  - Company Settings
     Client Group Settings
     Client Settings

Each tier of settings inherits the settings from **all** of the tiers above it unless explicitly expressed otherwise. As of v3.3 of Blesta, company and system settings have an 'inherit' field which determines whether or not that field can be inherited. Inherited settings are overwritten by the value of identical keys in the tier they are retrieved from. For example, if we would like to retrieve all of the client group settings for some client group, the result would include all client group settings, all company settings for that matching client group, and all system settings. In this case, if a client group setting and a company setting shared an identical key, the client group setting would be used because it takes precedence through the hierarchy over inherited duplicate keys.

Consider, for example, that the following settings exist:

```
System Settings
    - autodebit = true
    - default_currency = USD
Company Settings
    - autodebit = false
    - inv_days_before_renewal = 3
Client Group Settings
    - autodebit = true
    - inv_days_before_renewal = 1
    - autosuspend = true
```

## Fetch Client Group Settings with Inheritance

## Example Output

autodebit: true inv\_days\_before\_renewal: 1 autosuspend: true default\_currency: USD
